

DESIGN SYSTEM

# KamiCode Design Document

Aesthetic-heavy developer interface strategy for an AI-native competitive coding and skill verification platform.

AI-Native Evaluation

Developer Skill Graph

Verified Credentials

Startup Build Plan

# Design Document

KamiCode should feel like a serious developer arena: cinematic enough to excite engineering students, clean enough for recruiters, and technical enough to earn trust from strong programmers.

## 1. Visual Design Goal

The UI should not look like a generic SaaS dashboard or a cartoon Web3 app. It should feel like an AI-powered competitive coding cockpit where users enter, solve, compete, analyze, and build reputation.

Design phrase: **Algorithmic esports meets developer intelligence dashboard.**

## 2. Aesthetic Direction

**Dark Developer Arena**

Deep black and blue surfaces with glassy panels, grid textures, and focused contrast.

**Neon Compute Energy**

Cyan, violet, and green accents used for active states, AI insights, success, and live activity.

**Serious Technical Trust**

Avoid excessive crypto imagery. Use proof, metrics, code, graphs, and verified badges.

**Student Appeal**

Make progress feel game-like: streaks, ranks, skill bars, achievement cards, and live leaderboards.

**Recruiter Friendly**

Public profiles must remain readable, credible, and exportable as proof of ability.

**Startup Polish**

High spacing, clear hierarchy, strong typography, crisp cards, and confident microcopy.

## 3. Brand Personality

| Trait        | Meaning in UI                                                                            |
|--------------|------------------------------------------------------------------------------------------|
| Sharp        | Precise layout, strong alignment, no messy visual noise.                                 |
| Competitive  | Ranks, live activity, top-performer cards, challenge language.                           |
| Intelligent  | AI insight panels, complexity badges, code feedback, performance explanations.           |
| Aspirational | Profiles should make students feel like they are building a professional skill identity. |
| Trustworthy  | Verification pages, timestamps, reproducible metrics, clear proof structure.             |

## 4. Color System

| Token         | Color             | Usage                                     |
|---------------|-------------------|-------------------------------------------|
| Space Black   | #0B0F14           | Primary background                        |
| Panel Navy    | #111827 / #172033 | Cards, editor shells, dashboards          |
| Electric Cyan | #00E5FF           | Primary CTA, active highlights, AI status |

|              |         |                                                      |
|--------------|---------|------------------------------------------------------|
| Neon Violet  | #8B5CF6 | Achievement accents, credential glow, premium states |
| Matrix Green | #00FF9D | Success, terminal output, passed tests               |
| Signal Amber | #F59E0B | Warnings, medium difficulty                          |
| Error Pulse  | #FF5C7A | Wrong answer, runtime error, failed tests            |

## 5. Typography and Layout

- Headings: bold geometric sans-serif with tight spacing and high contrast.
- Body text: clean readable sans-serif, optimized for long problem statements.
- Code: Monaco or JetBrains Mono style inside the editor and terminal components.
- Numbers: large metric counters for runtime, rank, streak, and efficiency score.
- Layout: desktop-first, two-column problem arena with responsive mobile stacking.

## 6. Core Screens

| Screen            | Design Requirement                                                                                            |
|-------------------|---------------------------------------------------------------------------------------------------------------|
| Landing Page      | Hero: Turn your code into verified skill. Preview AI analysis, skill graph, leaderboard, and credential card. |
| Problem Arena     | Left: problem statement. Right: code editor. Bottom: terminal output. Top: streak, wallet optional, profile.  |
| Submission Result | Pass/fail, runtime, memory, test cases, AI analysis panel, efficiency gauge, improvement feedback.            |
| Leaderboard       | Top 3 glowing podium cards, ranked table, live activity feed, difficulty/topic filters.                       |
| Profile Dashboard | Skill graph, topic mastery bars, solved history, average efficiency, recent badges, share profile button.     |
| Verification Page | Digital proof certificate with problem, timestamp, score, AI analysis, and optional blockchain transaction.   |

## 7. Working Product Flowchart

### User Experience Flow

## 8. Component System

|                                                                                                            |                                                                                                   |                                                                                                    |
|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <p><b>Problem Card</b></p> <p>Difficulty badge, topic tags, solve count, average runtime.</p>              | <p><b>Code Editor Shell</b></p> <p>Language selector, run button, submit button, status pill.</p> | <p><b>Terminal Console</b></p> <p>Green-on-black output, failed test messages, runtime errors.</p> |
| <p><b>AI Analysis Panel</b></p> <p>Complexity badges, approach detected, feedback, optimization score.</p> | <p><b>Efficiency Gauge</b></p> <p>Circular or horizontal progress meter with neon fill.</p>       | <p><b>Skill Graph Card</b></p> <p>Topic mastery bars, trend line, weak-topic suggestions.</p>      |
| <p><b>Achievement Card</b></p> <p>Digital trophy card with proof status and share action.</p>              | <p><b>Leaderboard Row</b></p> <p>Rank, username, runtime, AI score, badge icon.</p>               | <p><b>Verification Certificate</b></p> <p>Public proof layout for important achievements.</p>      |

## 9. Visual Rules

- Use glow sparingly: buttons, active states, top ranks, and verified achievements only.
- Problem reading areas should remain comfortable and not over-stylized.
- Code editor must be the visual center of the problem arena.
- AI feedback should look premium and intelligent, not like a chatbot message.
- NFT/credential visuals should look like digital certificates, not cartoon collectibles.
- Every metric should have context: score, rank, topic, difficulty, and timestamp.

## 10. Microinteractions

- Submit button pulse when ready.
- AI analysis reveal animation after successful execution.
- Leaderboard row fade-in when rank updates.
- Achievement card glows briefly when unlocked.
- Skill graph bars animate from zero when profile loads.
- Terminal output types in quickly for a developer-console feel.

## 11. Design Prompt for UI Generation

Design a futuristic, developer-focused web application for KamiCode, an AI-native competitive programming platform. The visual style should combine a dark coding arena, AI analytics dashboard, and verified skill credential system. Use deep black backgrounds, cyan/violet/green neon accents,

glassmorphism panels, Monaco-style code editor, glowing leaderboard podiums, AI complexity cards, skill graph analytics, and digital certificate achievement cards. The design should appeal strongly to engineering students and developers while remaining credible for recruiters.

## 12. Final Design Principle

**Make users feel that every solve is not just practice - it is a measurable step in building their public developer identity.**
